

Semantic net →

- ① semantic network → meaningful graph ∴ semantic net → meaningful graph
- ② It is used to represent human memory or language.
- ③ It is used to analyze meaning of words within the sentence.
- ④ It is a Labelled directed graph.
- ⑤ It is a graphical way to represent the knowledge in terms of interconnected nodes & arcs.

- ⑥ Nodes represent
- objects
 - entities
 - states
 - attributes
 - events
- } in real world.

- ⑦ ArCs represent → Relation betⁿ the objects.
(link/edges)

- ⑧ Two types of relations →

- (a) Is-a → "is an instance of"
- Refers to specific members of a class.
 - Relates an instance or individual to generic class.

- (b) A-kind-of (Ako) → used to relate one class with other.
- Relates generic nodes to generic nodes

- ⑨ Semantic nets are easy to understand & can be easily extended

eg → Tree is a Living thing

obj relation obj

* more knowledge can be easily added to this net.

eg → Tree has leaves

obj R obj

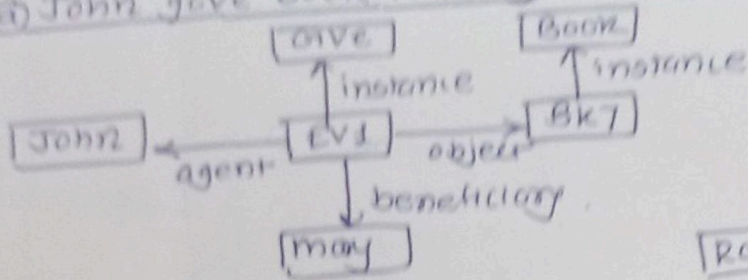

** Tree → Generic node

oak → Individual node

① Eg → To show an event

① John gave book to Mary.

② Ron took books from Sue.

- First create objects & events.
- Then instances, Bk7 - particular book.
- Then link them EV1 - particular event.

② John has height H1
 Bill has height H2
 John is taller than Bill.
